

Discussion: Limits, Failure Modes, and Future Replacement

Discussion: Limits, Failure Modes, and Future Replacement I

DigiPPPiP belongs to the broader landscape of relational technology, but it takes a specific position within it. Many contemporary systems replace, simulate, or optimize social contact. DigiPPPiP instead uses technology to give two human partners another surface for mutual attention. That difference matters ethically: the goal is not frictionless engagement, retention, or automated companionship, but a bounded practice in which each partner can see and respond to the other's agency.

Discussion: Limits, Failure Modes, and Future Replacement II

The strongest scholarship added by the digital turn is not a single theory but a triangulation. CSCW explains why the shared drawing space is an interactional resource, with social translucence and workspace awareness providing sharper design constraints for what partner activity should become visible [@tang1991collaborativework ; @erickson2000socialtranslucence ; @gutwin2002workspaceawareness]. Distance and grounding research explain why remote drawing needs evidence of understanding, repair, and re-entry rather than only a persistent file [@olson2000distance ; @clark1991grounding]. Presence and embodiment research explain why lightweight traces can carry felt co-presence without recreating the whole body [@lombard1997presence ; @biocca1997cyborg ; @lee2004presence]. Digital-intimacy and relatedness-technology research explains why rituals, minimal signals, traces, and joint action matter for strong-tie relationships while also warning that many prototypes lack robust effect evidence [@kaye2006clicked ; @hassenzahl2012love ; @neustaedter2012intimacy ; @vetere2005mediating ; @mcveighschult
